(54) Title: **METHOD AND DEVICE FOR BACKGROUND MONITORING OF AN AUDIO SOURCE**

(57) Abstract: The present invention relates to a method and mobile electronic device for enabling a user to simultaneously monitor two different audio signals. The mobile electronic device has a first and a second audio component for providing a first and a second audio signal, and an audio output for outputting an audio signal. Said audio output is connected to said first and second audio components. The mobile device further comprises a mixer, connected between said first and second audio component and said audio output for mixing said first and said second continuous audio signal to generate a mixed signal to be supplied to said audio output. The mixed signal comprises components of both audio signals so that a user can simultaneously monitor two different audio signals. An application is to enable a user to monitor an audio recording while using a mobile telephone.
